5. Algorithm Explanation
6. User Interface Components
7. Data Flow
8. Error Handling
9. Performance Optimization
10. Use Cases
11. Installation & Setup

🔍 System Overview

The AI Resume Screening System is a **machine learning-powered web application** that automates the process of ranking job candidates based on how well their resumes match a given job description. It uses **Natural Language Processing (NLP)** techniques to analyze text similarity and provide quantitative rankings.

Primary Purpose:

- **Automate** the initial screening of resumes
- **Rank** candidates objectively based on job requirements
- **Reduce** manual effort in HR processes
- **Provide** data-driven hiring insights

Target Users:

- HR professionals
- Recruitment agencies
- Hiring managers
- Small to medium businesses

🏗️ Technical Architecture

Framework Stack:

Frontend: Streamlit (Web UI)

Backend: Python

ML Libraries: Scikit-learn, TF-IDF

Visualization: Plotly, Matplotlib, Seaborn

PDF Processing: PyPDF2

Data Handling: Pandas, NumPy

Architecture Pattern:

- **Single-page application** with real-time processing
- **Client-server model** where Streamlit handles both frontend and backend
- **Stateless processing** - each session is independent
- **Memory-based storage** - no database required

🔧 Core Components

1. PDF Text Extraction (extract_text_from_pdf)

```
def extract_text_from_pdf(file):

    pdf = PdfReader(file)

    text = ""

    total_pages = len(pdf.pages)

    for i, page in enumerate(pdf.pages):
```

```
        extracted_text = page.extract_text()

        if extracted_text:

            text += extracted_text + " "

    return text.strip(), total_pages
```

What it does:

- Opens PDF files using PyPDF2 library
- Extracts text from each page sequentially
- Handles multi-page documents
- Returns both extracted text and page count
- Includes error handling for corrupted pages

Technical Details:

- Uses PyPDF2's PdfReader class
- Iterates through pdf.pages collection
- Concatenates text from all pages
- Tracks page count for statistics

2. Text Preprocessing (preprocess_text)

```
def preprocess_text(text):

    text = text.lower()                    # Convert to lowercase

    text = re.sub(r'\s+', ' ', text)       # Remove extra whitespace

    text = re.sub(r'[^\w\s@+\-.]', ' ', text)    # Remove special characters

    text = re.sub(r'\b\d+\b', '', text)        # Remove standalone numbers

    text = ' '.join(text.split())          # Clean extra spaces

    return text.strip()
```

Preprocessing Steps:

1. **Lowercase conversion**: Ensures case-insensitive matching
2. **Whitespace normalization**: Removes extra spaces and newlines
3. **Special character removal**: Keeps only alphanumeric, @, +, -, .
4. **Number removal**: Removes standalone numbers (keeps alphanumeric)
5. **Space cleanup**: Final cleanup of spacing

Why Each Step Matters:

- **Lowercase**: "Python" and "python" should be treated the same
- **Whitespace**: PDF extraction often has irregular spacing
- **Special chars**: Focus on meaningful words, not formatting
- **Numbers**: Remove noise like years, phone numbers
- **Final cleanup**: Ensures consistent text format

3. Resume Ranking Algorithm (rank_resumes)

```
def rank_resumes(job_description, resumes, resume_names):

    documents = [job_description] + resumes

    vectorizer = TfidfVectorizer(

        stop_words='english',      # Remove common words

        max_features=1000,         # Limit vocabulary size

        ngram_range=(1, 2),        # Include single words and pairs

        min_df=1,                  # Word must appear at least once

        max_df=0.95                # Ignore words in >95% of documents

    )

    vectors = vectorizer.fit_transform(documents).toarray()

    job_description_vector = vectors[0]

    resume_vectors = vectors[1:]

    cosine_similarities = cosine_similarity([job_description_vector], resume_vectors).flatten()
```

```
    return results_dataframe
```

Algorithm Breakdown:

Step 1: TF-IDF Vectorization

- **TF (Term Frequency)**: How often a word appears in a document
- **IDF (Inverse Document Frequency)**: How rare/common a word is across all documents
- **TF-IDF Score**: TF × IDF (higher for important, document-specific words)

Step 2: Vector Space Creation

- Each document becomes a numerical vector
- Vector dimensions = vocabulary size (max 1000 features)
- Each dimension represents a word's TF-IDF score

Step 3: Cosine Similarity Calculation

Similarity = (A · B) / (|A| × |B|)

- **A**: Job description vector
- **B**: Resume vector
- **Result**: Score from 0 (no similarity) to 1 (identical)

Why Cosine Similarity?

- Measures angle between vectors, not magnitude
- Focuses on content similarity, not document length
- Industry standard for text similarity

🎨 Key Features

1. Interactive Sidebar Configuration

Similarity Threshold Slider:

```
similarity_threshold = st.slider(
```

```
    "Minimum Similarity Threshold",
    min_value=0.0,
    max_value=1.0,
    value=0.1,
    step=0.05
)
```

- **Purpose**: Filter out low-scoring candidates
- **Range**: 0.0 to 1.0
- **Default**: 0.1 (10% similarity minimum)
- **Use Case**: Set higher thresholds for competitive positions

Skills Analysis Configuration:

```
skills_input = st.text_area(
    "Enter skills separated by commas:",
    value=default_skills
)
skill_keywords = [skill.strip() for skill in skills_input.split(",")]
```

- **Customizable skill list**: Add job-specific skills
- **Automatic detection**: Counts skill mentions in resumes
- **Correlation analysis**: Shows relationship between skills and scores

2. Advanced Visualizations

Interactive Bar Chart (Plotly)

```
fig = px.bar(
    filtered_results.head(10),
    x="Similarity_Score",
    y="Resume",
```

```
    orientation='h',
    color="Similarity_Score",
    color_continuous_scale="viridis"
)
```

Features:

- **Top 10 candidates**: Shows best matches
- **Color coding**: Darker colors = higher scores
- **Interactive**: Hover for details, zoom capabilities
- **Horizontal layout**: Easy to read resume names

Score Distribution Histogram

```
fig = px.histogram(results, x="Similarity_Score", nbins=20)
fig.add_vline(x=similarity_threshold, line_dash="dash", line_color="red")
```

Shows:

- **Distribution pattern**: How scores are spread
- **Threshold line**: Visual indicator of cutoff
- **Bin analysis**: Score ranges and frequency
- **Quality assessment**: Helps evaluate job description specificity

Skills Analysis Tab

```
skills_data = []
for resume in resumes:
    found_skills = extract_skills(resume, skill_keywords)
    skills_data.append({
        "Skills_Found": len(found_skills),
        "Skills_List": ", ".join(found_skills)
    })
```

Provides:

- **Skill count per resume**: Quantitative skill assessment
- **Skills list**: Specific skills found
- **Correlation analysis**: Skills vs. similarity score relationship

3. Comprehensive Reporting

Report Components:

1. **Basic Rankings**: Resume name, similarity score, rank
2. **File Statistics**: Page count, word count, character count
3. **Skills Analysis**: Skills found, skills count
4. **Metadata**: Generation timestamp, processing info

Export Format:

Generated_On,Resume,Similarity_Score,Word_Count,Rank,Skills_Found,Skills_List

2024-01-15 10:30:00,resume1.pdf,0.7234,450,1,5,"Python,SQL,Machine Learning"

🔄 Data Flow

Step-by-Step Process:

Input Collection

User uploads PDFs → Job description entered → Configuration set

1.

Text Extraction

PDF files → PyPDF2 → Raw text + page count

2.

Preprocessing

Raw text → Clean text → Standardized format

3.

Vectorization

Clean text → TF-IDF → Numerical vectors

4.

Similarity Calculation

Vectors → Cosine similarity → Similarity scores

5.

Ranking & Filtering

Scores → Sort → Apply threshold → Final rankings

6.

Visualization & Export

Rankings → Charts → Reports → Download

7.

Data Structures:

Results DataFrame:

```
{
    "Resume": ["resume1.pdf", "resume2.pdf"],
    "Similarity_Score": [0.7234, 0.6891],
    "Word_Count": [450, 380],
    "Rank": [1, 2]
}
```

Skills DataFrame:

```
{
```

```
    "Resume": ["resume1.pdf"],
    "Skills_Found": [5],
    "Skills_List": ["Python, SQL, Machine Learning, Data Analysis, Teamwork"]
}
```

⚠️ Error Handling

PDF Processing Errors

```
try:
    pdf = PdfReader(file)
    # ... processing
except Exception as e:
    st.error(f"Error reading PDF {file.name}: {str(e)}")
    return "", 0
```

Common Issues Handled:

- **Corrupted PDF files**: Graceful error messages
- **Password-protected PDFs**: Clear user notification
- **Scanned PDFs**: Warning about text extraction limitations
- **Empty files**: Skip processing, show warning

Text Processing Errors

```
try:
    extracted_text = page.extract_text()
    if extracted_text:
        text += extracted_text + " "
```

```
except Exception as page_error:
    st.warning(f"Error reading page {i+1}: {str(page_error)}")
    continue
```

Page-Level Recovery:

- **Individual page errors**: Skip problematic pages, continue processing
- **Partial extraction**: Use successfully extracted content
- **Progress tracking**: User sees which files are being processed

Algorithm Errors

```
try:
    vectors = vectorizer.fit_transform(documents).toarray()
    cosine_similarities = cosine_similarity([job_description_vector], resume_vectors)
except Exception as e:
    st.error(f"Error in ranking process: {str(e)}")
    return pd.DataFrame(), []
```

Ranking Failures:

- **Empty documents**: Return empty results with warning
- **Insufficient text**: Adjust TF-IDF parameters
- **Memory issues**: Implement feature limiting

⚡ Performance Optimization

TF-IDF Optimization

```
vectorizer = TfidfVectorizer(
    stop_words='english',      # Remove common words (reduces features)
```

```
    max_features=1000,        # Limit vocabulary (reduces memory)
    ngram_range=(1, 2),       # Balance context vs. performance
    min_df=1,                 # Minimum document frequency
    max_df=0.95               # Maximum document frequency
)
```

Performance Benefits:

- **max_features=1000**: Limits memory usage and processing time
- **stop_words removal**: Eliminates noise, focuses on meaningful terms
- **ngram_range=(1,2)**: Includes context without excessive features
- **min_df/max_df**: Filters out very rare/common words

Memory Management

```
# Process files one at a time
for i, file in enumerate(uploaded_files):
    text, page_count = extract_text_from_pdf(file)
    # Process immediately, don't store all in memory
```

Strategies:

- **Sequential processing**: One file at a time
- **Immediate cleanup**: Process and discard intermediate data
- **Progress tracking**: User feedback during long operations
- **Lazy loading**: Only load what's needed

UI Responsiveness

```
progress_bar = st.progress(0)
status_text = st.empty()

for i, file in enumerate(uploaded_files):
```

```
status_text.text(f"Processing {file.name}...")

# ... processing

progress_bar.progress(10 + (i + 1) * 70 // len(uploaded_files))
```

User Experience:

- **Progress indicators**: Shows processing status
- **Status updates**: Current file being processed
- **Non-blocking UI**: Interface remains responsive
- **Clear completion**: User knows when processing is done

💼 Use Cases

1. HR Departments

Scenario: Screening 100+ resumes for a software developer position

Process:

1. HR manager enters detailed job description
2. Uploads all resumes at once
3. Sets similarity threshold to 0.3 (30%)
4. Reviews top 20 candidates
5. Downloads report for stakeholder review

Benefits:

- **Time savings**: Minutes instead of hours
- **Consistency**: Same criteria applied to all candidates
- **Documentation**: Quantitative justification for decisions

2. Recruitment Agencies

Scenario: Multiple clients, different job requirements

Process:

1. Create job-specific skill lists
2. Adjust thresholds based on client requirements
3. Generate separate reports for each client

4. Use skills analysis for candidate development

Benefits:

- **Scalability**: Handle multiple positions simultaneously
- **Customization**: Tailor analysis to client needs
- **Value-add**: Provide detailed analytics to clients

3. Small Business Hiring

Scenario: Limited HR resources, need efficient screening

Process:

1. Use default settings for quick screening
2. Focus on top 5-10 candidates
3. Use skills analysis to identify training needs
4. Make data-driven hiring decisions

Benefits:

- **Resource efficiency**: Minimal time investment
- **Professional approach**: Systematic evaluation
- **Growth planning**: Identify skill gaps in candidates

4. Academic Institutions

Scenario: Hiring for research or teaching positions

Process:

1. Include academic keywords in job description
2. Add research skills to analysis
3. Use correlation analysis for skill importance
4. Consider both technical and soft skills

Benefits:

- **Academic focus**: Relevant skill detection
- **Research orientation**: Publication and grant keywords
- **Balanced evaluation**: Technical + interpersonal skills

🚀 Installation & Setup

Requirements

streamlit>=1.28.0

PyPDF2>=3.0.1

pandas>=1.5.0

numpy>=1.24.0

scikit-learn>=1.3.0

matplotlib>=3.6.0

seaborn>=0.12.0

plotly>=5.15.0

Installation Steps

1. **Create Virtual Environment**

```
python -m venv resume_screening_env

source resume_screening_env/bin/activate  # Linux/Mac

# or

resume_screening_env\Scripts\activate     # Windows
```

2. **Install Dependencies**

```
pip install streamlit PyPDF2 pandas numpy scikit-learn matplotlib seaborn plotly
```

3. **Save Code to File**

```
# Save the code as 'app.py'

nano app.py  # or use any text editor
```

4. **Run Application**

streamlit run app.py

5. **Access Application**

Open browser to: http://localhost:8501

Directory Structure

```
project_folder/
├── app.py              # Main application
├── requirements.txt    # Dependencies
├── README.md           # Documentation
└── sample_resumes/     # Test files (optional)
    ├── resume1.pdf
    ├── resume2.pdf
    └── job_description.txt
```

Configuration Options

Environment Variables:

```
export STREAMLIT_SERVER_PORT=8501
export STREAMLIT_SERVER_ADDRESS=0.0.0.0
export STREAMLIT_THEME_BASE="light"
```

Streamlit Config (.streamlit/config.toml):

```
[server]
```

```
port = 8501

address = "0.0.0.0"

[theme]

base = "light"

primaryColor = "#1f77b4"

backgroundColor = "#ffffff"

secondaryBackgroundColor = "#f0f2f6"
```

🔍 Advanced Usage Tips

1. Job Description Optimization

Best Practices:

- Include specific technical skills
- Mention required experience levels
- Add industry-specific keywords
- Include both hard and soft skills
- Use clear, descriptive language

Example Job Description:

"Software Developer position requiring 3+ years Python experience,

expertise in Django/Flask frameworks, SQL database management,

RESTful API development, and Agile methodology. Strong problem-solving

skills, teamwork abilities, and experience with cloud platforms

(AWS/Azure) preferred."

2. Skills Configuration

Technical Skills:

Python, Java, JavaScript, SQL, React, Node.js, Docker, Kubernetes,

AWS, Azure, Machine Learning, Data Analysis, Git, Agile

Soft Skills:

Communication, Leadership, Teamwork, Problem Solving, Time Management,

Project Management, Critical Thinking, Adaptability

Industry-Specific:

Healthcare: HIPAA, HL7, EMR, Clinical Research

Finance: SOX, Risk Management, Financial Modeling, Compliance

Marketing: SEO, SEM, Analytics, Campaign Management

3. Threshold Guidelines

- **0.1-0.2**: Very inclusive, catches most relevant candidates
- **0.3-0.4**: Moderate filtering, good balance
- **0.5-0.6**: Strict filtering, only close matches
- **0.7+**: Very strict, only exceptional matches

4. Results Interpretation

Score Ranges:

- **0.7-1.0**: Excellent match, priority candidates
- **0.5-0.7**: Good match, strong consideration
- **0.3-0.5**: Moderate match, worth reviewing
- **0.1-0.3**: Weak match, consider if limited options
- **0.0-0.1**: Poor match, likely not suitable

Skills Correlation:

- **High correlation (>0.7)**: Skills strongly predict fit
- **Moderate correlation (0.3-0.7)**: Skills somewhat predictive
- **Low correlation (<0.3)**: Skills may not be key factor

🎯 Conclusion

The AI Resume Screening System combines **natural language processing**, **machine learning**, and **user-friendly design** to create a powerful tool for modern recruitment. By automating the initial screening process, it enables HR professionals to focus on high-value activities like interviewing and candidate evaluation.

Key Strengths:

- **Objective evaluation**: Reduces human bias
- **Scalable processing**: Handles large volumes
- **Detailed analytics**: Provides actionable insights
- **User-friendly interface**: Minimal learning curve
- **Comprehensive reporting**: Supports decision-making

Future Enhancements:

- Integration with ATS systems
- Machine learning model improvements
- Multi-language support
- Advanced NLP features
- Cloud deployment options

This system represents a practical application of AI in HR technology, demonstrating how machine learning can augment human decision-making in recruitment processes.
